

## Cubes and Cube Roots: Exercise 7.1

**Q.1 Which of the following numbers are not perfect cubes?**

**(i) 216      (ii) 128      (iii) 1000      (iv) 100      (v) 46656**

**Sol. (i)** Firstly, we need to find out prime factors of 216:

$$2 \overline{)216}$$

$$2 \overline{)108}$$

$$2 \overline{)54}$$

$$3 \overline{)27}$$

$$3 \overline{)9}$$

$$3 \overline{)3}$$

$$1$$

So, prime factors of 216 =  $2 \times 2 \times 2 \times 3 \times 3 \times 3$

Since in prime factors, each prime factor is appearing in triplet form.

Thus, 216 is a perfect cube.

**(ii)** Firstly, we need to find out prime factors of 128:

$$2 \overline{)128}$$

$$2 \overline{)64}$$

$$2 \overline{)32}$$

$$2 \overline{)16}$$

$$2 \overline{)8}$$

$$2 \overline{)4}$$

$$2 \overline{)2}$$

$$1$$

So, prime factors of 128 =  $2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2$

Since in prime factors, each prime factor is not appearing in triplet form.

Thus, 128 is not a perfect cube.

**(iii)** Firstly, we need to find out prime factors of 1000

$$2 \overline{)1000}$$

$$2 \overline{)500}$$

$$2 \overline{)250}$$

$$5 \overline{)125}$$

$$5 \overline{)25}$$

$$5 \overline{)5}$$

$$1$$

So, prime factors of 1000 =  $2 \times 2 \times 2 \times 5 \times 5 \times 5$

Since in prime factors, each prime factor is appearing in triplet form.

Thus, 1000 is a perfect cube.

(iv) Firstly, we need to find out prime factors of 100:

$$2 \overline{)100}$$

$$2 \overline{)50}$$

$$5 \overline{)25}$$

$$5 \overline{)5}$$

$$1$$

So, prime factors of 1000 =  $2 \times 2 \times 2 \times 5 \times 5$

Since in prime factors, each prime factor is not appearing in triplet form.

Thus, 100 is not a perfect cube.

(v) Firstly, we need to find out prime factors of 46656:

$$2 \overline{)46656}$$

$$2 \overline{)23328}$$

$$2 \overline{)11664}$$

$$2 \overline{)5832}$$

$$2 \overline{)2916}$$

$$2 \overline{)1458}$$

$$3 \overline{)729}$$

$$3 \overline{)243}$$

$$3 \overline{)81}$$

$$3 \overline{)27}$$

$$3 \overline{)9}$$

$$3 \overline{)3}$$

$$1$$

So, prime factors of 46656 =  $2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 3 \times 3 \times 3 \times 3 \times 3 \times 3$

Since in prime factors, each prime factor is appearing in triplet form.

Thus, 46656 is a perfect cube.

**Q.2 Find the smallest number by which each of the following numbers must be multiplied to obtain a perfect cube.**

(i) 243

(ii) 256

(iii) 72

(iv) 6750

(v) 100

**Sol. (i)** Firstly, we need to find out prime factors of 243:

$$3 \overline{)243}$$

$$3 \overline{)81}$$

$$3 \overline{)27}$$

$$3 \overline{)9}$$

$$3 \overline{)3}$$

$$1$$

So, prime factors of  $243 = 3 \times 3 \times 3 \times 3 \times 3$

In prime factors, '3' is not in triplet form. So, we need one more '3' to be multiplied so that 243 becomes a cube number.

$$\begin{aligned}\text{So, } 243 \times 3 &= 3 \times 3 \times 3 \times 3 \times 3 \times 3 \\ &= 729\end{aligned}$$

Which is a perfect cube.

Thus, the 3 is smallest number by which 243 should be multiplied to obtain a perfect cube.

**(ii)** Firstly, we need to find out prime factors of 256:

$$2 \overline{)256}$$

$$2 \overline{)128}$$

$$2 \overline{)64}$$

$$2 \overline{)32}$$

$$2 \overline{)16}$$

$$2 \overline{)8}$$

$$2 \overline{)4}$$

$$2 \overline{)2}$$

$$1$$

So, prime factors of  $256 = 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2$

In prime factors, '2' is not in triplet form. So, we need one more '2' to be multiplied so that 256 becomes a cube number.

$$\text{So, } 256 \times 2 = 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 = 512 \text{ is a perfect cube.}$$

Thus, the smallest number is 2 by which 256 should be multiplied to obtain a perfect cube.

**(iii)** Firstly, we need to find out prime factors of 72:

$$2 \overline{)72}$$

$$2 \overline{)36}$$

$$2 \overline{)18}$$

$$3 \overline{)9}$$

$$3 \overline{)3}$$

$$1$$

So, prime factors of  $72 = 2 \times 2 \times 2 \times 3 \times 3$

In prime factors, '3' is not in triplet form. So, we need one more '3' to be multiplied so that 72 becomes a cube number.

$$\begin{aligned}\text{So, } 72 \times 3 &= 2 \times 2 \times 2 \times 3 \times 3 \times 3 \\ &= 216 \text{ is a perfect cube.}\end{aligned}$$

Thus, the smallest number is 3 by which 72 must be multiplied to obtain a perfect cube.

**(iv)** Firstly, we need to find out prime factors of 675:

$$3 \overline{)675}$$

$$3 \overline{)225}$$

$$3 \overline{)75}$$

$$5 \overline{)25}$$

$$5 \overline{)5}$$

$$1$$

So, prime factors of 675 =  $3 \times 3 \times 3 \times 5 \times 5$

In prime factors, '5' is not in triplet form. So, we need one more '5' to be multiplied so that 675 becomes a cube number.

So,  $675 \times 5 = 3 \times 3 \times 3 \times 5 \times 5 \times 5$   
 $= 3375$  is a perfect cube.

Thus, the smallest number is 5 by which 675 must be multiplied to obtain a perfect cube.

(v) Firstly, we need to find out prime factors of 100:

$$2 \overline{)100}$$

$$2 \overline{)50}$$

$$5 \overline{)25}$$

$$5 \overline{)5}$$

$$1$$

So, prime factors of 100 =  $2 \times 2 \times 5 \times 5$

In prime factors, '2 and 5' is not in triplet form. So, we need one more '2 and 5' to be multiplied so that 100 becomes a cube number.

So,  $100 \times 2 \times 5 = 2 \times 2 \times 2 \times 5 \times 5 \times 5$   
 $= 1000$  is a perfect cube.

Thus, the smallest number is  $2 \times 5 = 10$  by which 100 must be multiplied to obtain a perfect cube.

**Q.3 Find the smallest number by which each of the following numbers must be divided to obtain a perfect cube.**

(i) 81

(ii) 128

(iii) 135

(iv) 192

(v) 704

**Sol. (i)** Firstly, we need to find out prime factors of 81:

$$3 \overline{)81}$$

$$3 \overline{)27}$$

$$3 \overline{)9}$$

$$3 \overline{)3}$$

$$1$$

So, prime factors of 81 =  $3 \times 3 \times 3 \times 3$

In prime factors, '3' is not in triplet form. So, we need to reduce one '3' by dividing so that 81 becomes a cube number.

So,  $81 \div 3 = 3 \times 3 \times 3$   
 $= 27$  is a perfect cube.

Thus, the smallest number is 3 by which 81 should be divided to obtain a perfect cube.

(ii) Firstly, we need to find out prime factors of 128:

$$\begin{array}{r}
 2 \overline{)128} \\
 2 \overline{)64} \\
 2 \overline{)32} \\
 2 \overline{)16} \\
 2 \overline{)8} \\
 2 \overline{)4} \\
 2 \overline{)2} \\
 \underline{1}
 \end{array}$$

So, prime factors of 128 =  $2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2$

In prime factors, '2' is not in triplet form. So, we need to reduce one '2' by dividing so that 128 becomes a cube number.

So,  $128 \div 2 = 2 \times 2 \times 2 \times 2 \times 2 \times 2$   
 $= 64$  is a perfect cube

Thus, the smallest number is 2 by which 128 must be divided to obtain a perfect cube.

**(iii)** Firstly, we need to find out prime factors of 135:

$$\begin{array}{r}
 3 \overline{)135} \\
 3 \overline{)45} \\
 3 \overline{)15} \\
 5 \overline{)5} \\
 \underline{1}
 \end{array}$$

So, prime factors of 135 =  $3 \times 3 \times 3 \times 5$

In prime factors, '5' is not in triplet form. So, we need to reduce one '5' by dividing so that 135 becomes a cube number.

So,  $135 \div 5 = 3 \times 3 \times 3$   
 $= 27$  is a perfect cube.

Thus, the smallest number is 5 by which 135 must be divided to obtain a perfect cube.

**(iv)** Firstly, we need to find out prime factors of 192:

$$\begin{array}{r}
 2 \overline{)192} \\
 2 \overline{)96} \\
 2 \overline{)48} \\
 2 \overline{)24} \\
 2 \overline{)12} \\
 2 \overline{)6} \\
 2 \overline{)3} \\
 \underline{1}
 \end{array}$$

So, prime factors of 192 =  $2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 3$

In prime factors, '3' is not in triplet form. So, we need to reduce one '3' by dividing so that 192 becomes a cube number.

So,  $192 \div 3 = 2 \times 2 \times 2 \times 2 \times 2 \times 2$   
 $= 64$  is a perfect cube.

Thus, the smallest number is 3 by which 192 must be divided to obtain a perfect cube.

(v) Firstly, we need to find out prime factors of 704:

$$\begin{array}{r} 2 \overline{)704} \\ 2 \overline{)352} \\ 2 \overline{)176} \\ 2 \overline{)88} \\ 2 \overline{)44} \\ 2 \overline{)22} \\ 11 \overline{)11} \\ \underline{1} \end{array}$$

So, prime factors of 704 =  $2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 11$

In prime factors, '11' is not in triplet form. So, we need to reduce one '11' by dividing so that 704 becomes a cube number.

$$\begin{aligned} \text{So, } 704 \div 11 &= 2 \times 2 \times 2 \times 2 \times 2 \times 2 \\ &= 64 \text{ is a perfect cube.} \end{aligned}$$

Thus, the smallest number is 11 by which 704 must be divided to obtain a perfect cube.

**Q.4 Parikshit makes a cuboid of plasticine of sides 5 cm, 2 cm, 5 cm. How many such cuboids will he need to form a cube?**

**Sol.** Given: sides of cuboidal plasticine: 5 cm, 2 cm, 5 cm.

Since, volume of cuboid =  $l \times b \times h$

$$\begin{aligned} &= 5 \text{ cm} \times 2 \text{ cm} \times 5 \text{ cm} \\ &= (5 \times 5 \times 2) \text{ cm}^3 \end{aligned}$$

Since, in given volume two 5s and one 2 are not in a triplet form.

So, multiplying its volume by  $2 \times 2 \times 5 = 20$ , so that it will be a perfect cube.

$$\begin{aligned} \text{Therefore, } (5 \times 5 \times 2 \times 2 \times 2 \times 5) &= (5 \times 5 \times 5 \times 2 \times 2 \times 2) \\ &= 1000 \text{ is a perfect cube.} \end{aligned}$$

Thus, 20 cuboids will be required to form a cube.
